A revolutionary remedy for insect bites! Chemical Free!

Eliminates itchiness and inflammation from mosquito, Sandfly bites and minor (non poisonous) jellyfish stings in just a few clicks.

Mosquito-Click is a revolutionary and effective method for eliminating irritation and the unsightly effects of insect bites.

Too often we find that our nights are spoilt by mosquitoes. Itchiness resulting from bites persists for a long time and if we give in to temptation to scratch, we end up with skin irritations that can be more serious than the initial bite. To eliminate these effects, a small and very practical device called the Mosquito-Click was invented.

HOW DOES IT WORK?

It functions with piezoelectricity i.e. the generation of electric currents by the compression or expansion of quartz and similar crystalline substances. Mosquito-Click therefore does not need a battery to function and its small and practical size makes it convenient to carry along anywhere. It is now a generally accepted fact that local reactions such as itches, pains and swelling are eliminated in minutes by the reduction or inhibition of histamine. Furthermore, any irritating or poisonous substance introduced under the skin by an insect is altered and therefore inactivated by the application of electric pressure.

INSTRUCTIONS FOR USE

Hold the device like a syringe and position the narrow end on the bite. Press the button a few times. The number of clicks will differ according to the result required. Only 4 to 5 clicks to treat itching and 8 to 10 clicks to prevent swelling. The number of clicks can be halved for children.

The effect of the Mosquito-Click is felt a few minutes after use.

Each Mosquito-Click has about 25,000 clicks which will approximately treat about 5,000 bites.
