TAKING TEMPERATURE DOESN'T GET ANY EASIER THAN THIS!

Sooner or later every child gets sick and has a fever. When this occurs, it can be very helpful to know exactly what the child's temperature is. You want to know whether there is only a slight fever or if the fever is possibly at a dangerous level that requires urgent medical attention. Over time, you then also want to know if the fever is going up or down with treatment.

But taking an accurate temperature has long been a problem for parents. Until now...

Digital thermometers that parents use to take the temperature under the arm have always been popular, but their biggest disadvantage is that they take so long to register a reading. It is not always easy to hold a thermometer under a child's arm for a minute or two when the child is sick, distressed and possibly wriggling around.

Ear thermometers overcome this problem by recording the temperature within a couple of seconds. But they have one major disadvantage. Many parents report huge difficulty using them, especially on infants. Parents often state that if they take the temperature more than once, they get very different results each time. This is usually because it can be difficult to get the probe deep enough into the child's ear to record an accurate reading. As such, many parents find ear thermometers inaccurate and unreliable.

But technology seems to have solved the age-old problem of temperature measurement with the development of the new Forehead Thermometer that uses advanced infrared technology. This amazing product measures the temperature on the child's forehead and gives an accurate and reliable temperature reading within 2 seconds.

The Forehead Thermometer has the following major advantages over other thermometers:

- It is much easier to use than all other thermometers.
- It is much gentler on the child than oral, rectal, underarm and in-ear thermometers because it is truly non-invasive.
- It is exceptionally accurate and reliable.
- It is the most hygienic of all thermometers.

- The temperature of the patient is not only displayed on the screen but is also spoken out loud.
- Best of all, it can be reliably used on newborns, infants, children or adults.

And when you consider all of these significant advantages, in conjunction with the fact that it costs a great deal less than ear thermometers, the Forehead Thermometer is clearly an essential item for any family, especially one with small children!
